What additional information would you ask from the product team?

- If the criteria is empty as shown in the screenshot does that mean everyone is eligible to submit their responses?
- Are the poll fields like frequency,iteration are editable after posting or in the future iteration?
- Does the poll status have to get changed on the 7th day in the sense @ 23:59 of 7th day or 7days wrt to the time of poll creation?

Test Scenarios:

- Test whether the status of the poll is changing on the exact date ie 7th day
- Test whether the poll with once as frequency has no paused state.
- Check whether the last sent date is always lesser than or equal to next on date.
- Check whether the user is not able to submit the response once the poll is closed.

What kind of test data would you need to create?

- Username and password of the poll creator and the user.

Can you take one test case from these scenarios and detail how it would look like?

- A poll with frequency once created has to be in Active state.
- Check whether the status is active even though there were no pending iteration and not in paused status.
- Check that the users are able to submit their responses.
- Check that the poll moves to "closed" state after 7 days of creation.
- Check that the users are not able to submit their response.
